### Lectures Description

We cover everything you need to build your first website. From creating your first page through to uploading your website to the internet. We'll use the world's most popular (and free) web design tool called Visual Studio Code. There are exercise files you can download and then work along with me. At the end of each video I have a downloadable version of where we are in the process so that you can compare your project with mine. This will enable you to see easily where you might have a problem. We will delve into all the good stuff such as how to create your very own mobile burger menu from scratch learning some basic JavaScript and jQuery.

If that all sounds a little too fancy - don't worry, this course is aimed at people new to web design and who have never coded before. We'll start right at the beginning and work our way through step by step.

### Lecture Notes

Thank you for your helpful video. May I ask what is the application use to demo the animation at [4:24], is it the runnable mobile application?

As what I know, Figma Mirror app cannot do that. Please help me

Great thanks

Great tutorial! I'm subscribing. I'm just wondering if is this feasible to be materialized in a real project or can be integrated in an actual app code?

Awesome video. Sometimes, we have got to try and push the possibilities of designs and not be bounded by codes. The fact that the design itself is a push from the norm, it is only expected that to code it would require some level of thinking out of the box. That is what differentiates yourself from others who are just building on top of someone else's code.
